

# *Firewalls*

# Firewalls

- ❑ *Firewall decides what to let in to internal network and/or what to let out*
- ❑ ***Access control*** for the network

# *Firewall as Secretary*

- ❑ *A firewall is like a **secretary***
- ❑ *To meet with an executive*
  - *First contact the secretary*
  - *Secretary decides if meeting is important*
  - *So, secretary filters out many requests*
- ❑ *You want to meet chair of CS department?*
  - *Secretary does some filtering*
- ❑ *You want to meet POTUS?*
  - *Secretary does lots of filtering*

# *Firewall Terminology*

- ❑ *No standard firewall terminology*
- ❑ *Types of firewalls*
  - *Packet filter* works at network layer
  - *Stateful packet filter* transport layer
  - *Application proxy* application layer
- ❑ *Lots of other terms often used*
  - *E.g., “deep packet inspection”*

# Packet Filter

- ❑ *Operates at network layer*
- ❑ *Can filters based on...*
  - *Source IP address*
  - *Destination IP address*
  - *Source Port*
  - *Destination Port*
  - *Flag bits (SYN, ACK, etc.)*
  - *Egress or ingress*

# Packet Filter

- ❑ *Advantages?*
  - *Speed*
- ❑ *Disadvantages?*
  - *No concept of state*
  - *Cannot see TCP connections*
  - *Blind to application data*

# Packet Filter

- ❑ *Configured via Access Control Lists (ACLs)*
  - *Different meaning than at start of Chapter 8*

<i>Action</i>	<i>Source IP</i>	<i>Dest IP</i>	<i>Source Port</i>	<i>Dest Port</i>	<i>Protocol</i>	<i>Flag Bits</i>
<i>Allow</i>	<i>Inside</i>	<i>Outside</i>	<i>Any</i>	<i>80</i>	<i>HTTP</i>	<i>Any</i>
<i>Allow</i>	<i>Outside</i>	<i>Inside</i>	<i>80</i>	<i>&gt; 1023</i>	<i>HTTP</i>	<i>ACK</i>
<i>Deny</i>	<i>All</i>	<i>All</i>	<i>All</i>	<i>All</i>	<i>All</i>	<i>All</i>

- ❑ *Q: Intention?*
- ❑ *A: Restrict traffic to Web browsing*

# *TCP ACK Scan*

- ❑ *Attacker scans for open ports thru firewall*
  - *Port scanning often first step in network attack*
- ❑ *Attacker sends packet with ACK bit set, **without** prior 3-way handshake*
  - *Violates TCP/IP protocol*
  - *ACK packet pass thru packet filter firewall*
  - *Appears to be part of an ongoing connection*
  - *RST sent by recipient of such packet*

# TCP ACK Scan

- ❑ Attacker knows port 1209 open thru firewall
- ❑ A **stateful packet filter** can prevent this
  - Since scans not part of established connections

# Stateful Packet Filter

- ❑ Adds **state** to packet filter
- ❑ Operates at transport layer
- ❑ **Remembers** TCP connections, flag bits, etc.
- ❑ Can even remember UDP packets (e.g., DNS requests)

# Stateful Packet Filter

## □ Advantages?

- *Can do everything a packet filter can do plus...*
- *Keep track of ongoing connections (e.g., prevents TCP ACK scan)*

## □ Disadvantages?

- *Cannot see application data*
- *Slower than packet filtering*

# Application Proxy

- ❑ A **proxy** is something that acts on your behalf
- ❑ Application proxy looks at incoming application data
- ❑ Verifies that data is safe before letting it in

# Application Proxy

- *Advantages?*
  - *Complete view of connections and applications data*
  - *Filter bad data at application layer (viruses, Word macros)*
- *Disadvantages?*
  - *Speed*

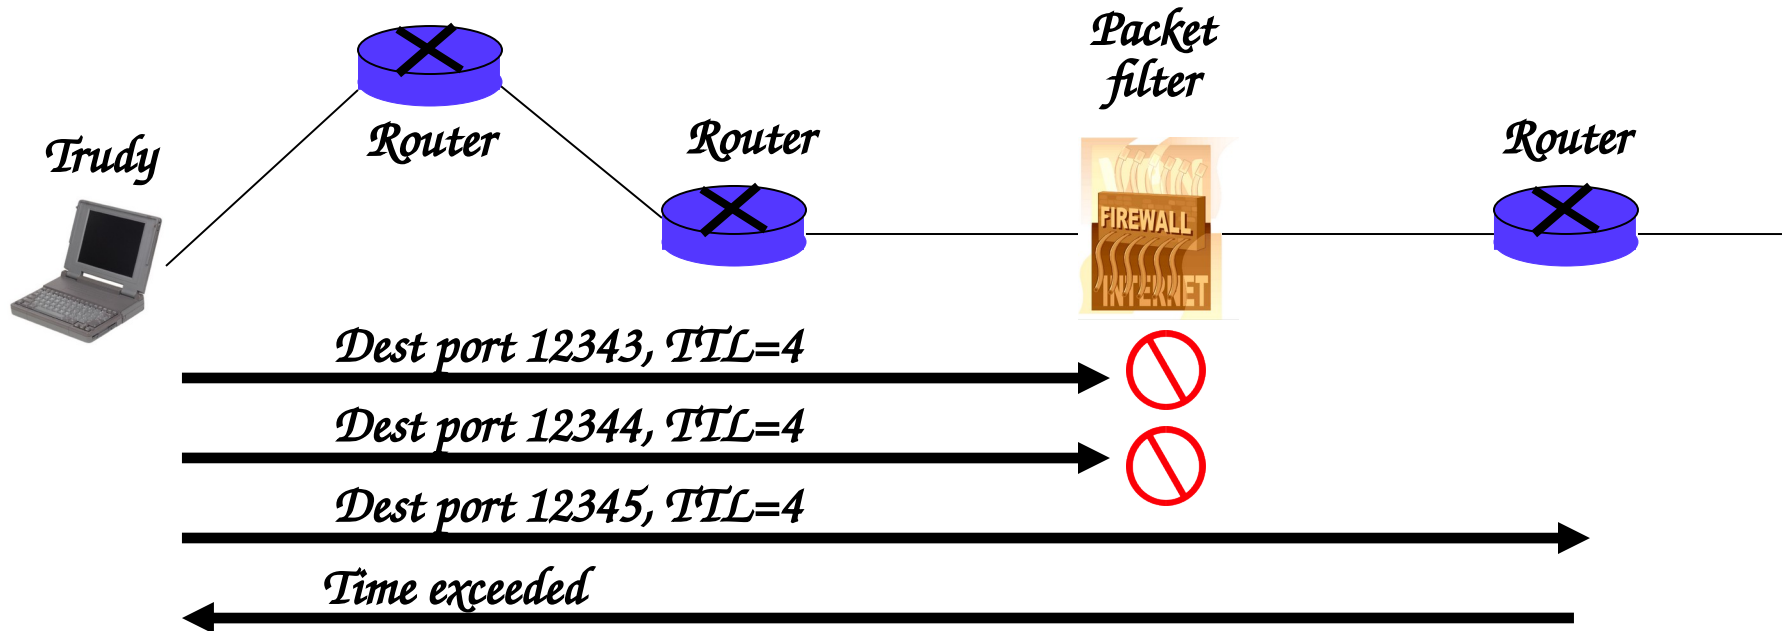

# *Application Proxy*

- ❑ *Creates a new packet before sending it thru to internal network*
- ❑ *Attacker must talk to **proxy** and convince it to forward message*
- ❑ *Proxy has complete view of connection*
- ❑ *Can prevent some scans stateful packet filter cannot*  
*next slides*

# Firewalk

- ❑ *Tool to scan for open ports thru firewall*
- ❑ *Attacker knows IP address of firewall and IP address of one system inside firewall*
  - *Set TTL to 1 more than number of hops to firewall, and set destination port to  $\mathcal{N}$*
- ❑ *If firewall allows data on port  $\mathcal{N}$  thru firewall, get **time exceeded** error message*
  - *Otherwise, no response*

# Firewalk and Proxy Firewall

- ❑ This will **not** work thru an application proxy (why?)
- ❑ The proxy creates a new packet, destroys old TTL

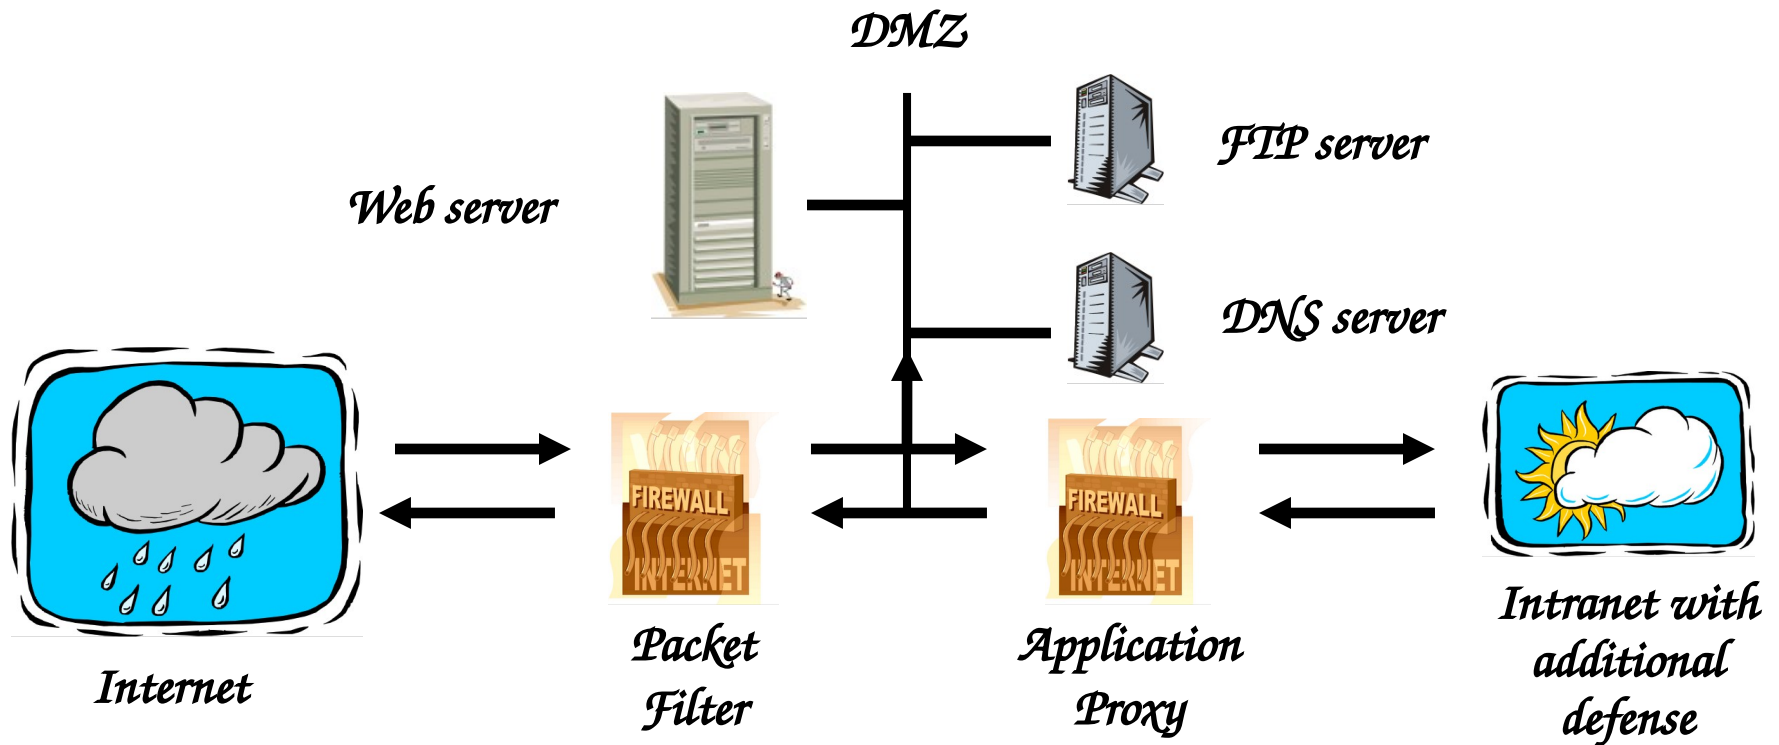

# *Deep Packet Inspection*

- ❑ *Many buzzwords used for firewalls*
  - *One example: **deep packet inspection***
- ❑ *What could this mean?*
- ❑ *Look into packets, but don't really “process” the packets*
  - *Like an application proxy, but faster*

# Firewalls and Defense in Depth

## □ Typical network security architecture

# *Intrusion Detection Systems*

# *Intrusion Prevention*

- ❑ *Want to keep bad guys out*
- ❑ *Intrusion prevention is a traditional focus of computer security*
  - *Authentication is to prevent intrusions*
  - *Firewalls a form of intrusion prevention*
  - *Virus defenses aimed at intrusion prevention*
  - *Like locking the door on your car*

# *Intrusion Detection*

- ❑ *In spite of intrusion prevention, bad guys will sometime get in*
- ❑ *Intrusion detection systems (**IDS**)*
  - *Detect attacks in progress (or soon after)*
  - *Look for unusual or suspicious activity*
- ❑ *IDS evolved from log file analysis*
- ❑ *IDS is currently a **hot** research topic*
- ❑ *How to respond when intrusion detected?*
  - *We don't deal with this topic here...*

# *Intrusion Detection Systems*

- ❑ *Who is likely intruder?*
  - *May be outsider who got thru firewall*
  - *May be evil insider*
- ❑ *What do intruders do?*
  - *Launch well-known attacks*
  - *Launch variations on well-known attacks*
  - *Launch new/little-known attacks*
  - *“Borrow” system resources*
  - *Use compromised system to attack others. etc.*

# IDS

- ❑ *Intrusion detection **approaches***
  - *Signature-based IDS*
  - *Anomaly-based IDS*
- ❑ *Intrusion detection **architectures***
  - *Host-based IDS*
  - *Network-based IDS*
- ❑ *Any IDS can be classified as above*
  - *In spite of marketing claims to the contrary!*

# *Host-Based IDS*

- ❑ *Monitor activities on hosts for*
  - *Known attacks*
  - *Suspicious behavior*
- ❑ *Designed to detect attacks such as*
  - *Buffer overflow*
  - *Escalation of privilege, ...*
- ❑ *Little or no view of network activities*

# *Network-Based IDS*

- ❑ *Monitor activity on the network for...*
  - *Known attacks*
  - *Suspicious network activity*
- ❑ *Designed to detect attacks such as*
  - *Denial of service*
  - *Network probes*
  - *Malformed packets, etc.*
- ❑ *Some overlap with firewall*
- ❑ *Little or no view of host-base attacks*
- ❑ *Can have both host and network IDS*

# *Signature Detection Example*

- ❑ *Failed login attempts may indicate password cracking attack*
- ❑ *IDS could use the rule “ $N$  failed login attempts in  $M$  seconds” as **signature***
- ❑ *If  $N$  or more failed login attempts in  $M$  seconds, IDS warns of attack*
- ❑ *Note that such a warning is specific*
  - *Admin knows what attack is suspected*
  - *Easy to verify attack (or false alarm)*

# Signature Detection

- ❑ *Suppose IDS warns whenever  $N$  or more failed logins in  $M$  seconds*
  - *Set  $N$  and  $M$  so false alarms not common*
  - *Can do this based on “normal” behavior*
- ❑ *But, if Trudy knows the signature, she can try  $N$   1 logins every  $M$  seconds...*
- ❑ *Then signature detection slows down Trudy, but might not stop her*

# *Signature Detection*

- ❑ *Many techniques used to make signature detection more robust*
- ❑ *Goal is to detect “almost” signatures*
- ❑ *For example, if “about”  $N$  login attempts in “about”  $M$  seconds*
  - *Warn of possible password cracking attempt*
  - *What are reasonable values for “about”?*
  - *Can use statistical analysis, heuristics, etc.*
  - *Must not increase false alarm rate too much*

# *Signature Detection*

- ❑ *Advantages of signature detection*
  - *Simple*
  - *Detect known attacks*
  - *Know which attack at time of detection*
  - *Efficient (if reasonable number of signatures)*
- ❑ *Disadvantages of signature detection*
  - *Signature files must be kept up to date*
  - *Number of signatures may become large*
  - *Can only detect known attacks*
  - *Variation on known attack may not be detected*

# *Anomaly Detection*

- ❑ *Anomaly detection systems look for unusual or abnormal behavior*
- ❑ *There are (at least) two challenges*
  - *What is normal for this system?*
  - *How “far” from normal is abnormal?*
- ❑ *No avoiding statistics here!*
  - ***mean** defines normal*
  - ***variance** gives distance from normal to abnormal*

# *How to Measure Normal?*

- *How to measure normal?*
  - *Must measure during “representative” behavior*
  - *Must not measure during an attack...*
  - *...or else attack will seem normal!*
  - *Normal is statistical **mean***
  - *Must also compute **variance** to have any reasonable idea of abnormal*

# *How to Measure Abnormal?*

- ❑ *Abnormal is relative to some “normal”*
  - *Abnormal indicates possible attack*
- ❑ *Statistical discrimination techniques include*
  - *Bayesian statistics*
  - *Linear discriminant analysis (LDA)*
  - *Quadratic discriminant analysis (QDA)*
  - *Neural nets, hidden Markov models (HMMs), etc.*
- ❑ *Fancy modeling techniques also used*
  - *Artificial intelligence*
  - *Artificial immune system principles*
  - *Many, many, many others*

# *Anomaly Detection (1)*

- *Spse we monitor use of three commands:  
open, read, close*
- *Under normal use we observe Alice:  
open, read, close, open, open, read, close, ...*
- *Of the six possible ordered pairs, we see four pairs are  
normal for Alice,  
(open,read), (read,close), (close,open), (open,open)*
- *Can we use this to identify unusual activity?*

# *Anomaly Detection (1)*

- ❑ *We monitor use of the three commands  
open, read, close*
- ❑ *If the ratio of abnormal to normal pairs is “too high”, warn  
of possible attack*
- ❑ *Could improve this approach by*
  - *Also use expected frequency of each pair*
  - *Use more than two consecutive commands*
  - *Include more commands/behavior in the model*
  - *More sophisticated statistical discrimination*

## Anomaly Detection (2)

- Over time, Alice has accessed file  $F_n$  at rate  $H_n$

$H_0$	$H_1$	$H_2$	$H_3$
.10	.40	.40	.10

- Recently, "Alice" has accessed  $F_n$  at rate  $A_n$

$A_0$	$A_1$	$A_2$	$A_3$
.10	.40	.30	.20

- Is this normal use for Alice?
- We compute  $S = (H_0 - A_0)^2 + (H_1 - A_1)^2 + \dots + (H_3 - A_3)^2 = .02$ 
  - We consider  $S < 0.1$  to be normal, so this is normal
- How to account for use that varies over time?

## Anomaly Detection (2)

- To allow “normal” to adapt to new use, we update averages:

$$H_n = 0.2A_n + 0.8H_n$$

- In this example,  $H_n$  are updated...  $H_2 = 0.2 \times 0.3 + 0.8 \times 0.4 = 0.38$   
and  $H_3 = 0.2 \times 0.2 + 0.8 \times 0.1 = 0.12$

- And we now have

$H_0$	$H_1$	$H_2$	$H_3$
.10	.40	.38	.12

## Anomaly Detection (2)

- The updated long term average is

$H_0$	$H_1$	$H_2$	$H_3$
.10	.40	.38	.12

- Suppose new observed rates...

$A_0$	$A_1$	$A_2$	$A_3$
.10	.30	.30	.30

- Is this normal use?

- Compute  $S = (H_0 - A_0)^2 + \dots + (H_3 - A_3)^2 = .0488$

○ Since  $S = .0488 < 0.1$  we consider this normal

- And we again update the long term averages:

$$H_n = 0.2A_n + 0.8H_n$$

# Anomaly Detection (2)

- *The starting averages were:*

$H_0$	$H_1$	$H_2$	$H_3$
.10	.40	.40	.10

- *After 2 iterations, averages are:*

$H_0$	$H_1$	$H_2$	$H_3$
.10	.38	.36 4	.15 6

- *Statistics slowly evolve to match behavior*
- *This reduces false alarms for SA*
- *But also opens an avenue for attack, ..*
  - *Suppose Trudy **always** wants to access  $F_3$*
  - *Can she convince IDS this is normal for Alice?*

## Anomaly Detection (2)

- ❑ *To make this approach more robust, must incorporate the variance*
- ❑ *Can also combine N stats  $S_i$  as, say,*  
$$T = (S_1 + S_2 + S_3 + \dots + S_N) / N$$
*to obtain a more complete view of “normal”*
- ❑ *Similar (but more sophisticated) approach is used in an IDS known as **NIDES***
- ❑ *NIDES combines anomaly & signature IDS*

# *Anomaly Detection Issues*

- ❑ *Systems constantly evolve and so must IDS*
  - *Static system would place huge burden on admin*
  - *But evolving IDS makes it possible for attacker to (slowly) convince IDS that an attack is normal*
  - *Attacker may win simply by “going slow”*
- ❑ *What does “abnormal” really mean?*
  - *Indicates there may be an attack*
  - *Might not be any specific info about “attack”*
  - *How to respond to such vague information?*
  - *In contrast, signature detection is very specific*

# *Anomaly Detection*

## ❑ *Advantages?*

- *Chance of detecting unknown attacks*

## ❑ *Disadvantages?*

- *Cannot use anomaly detection alone...*
- *...must be used with signature detection*
- *Reliability is unclear*
- *May be subject to attack*
- *Anomaly detection indicates “something unusual”, but lacks specific info on possible attack*

# *Anomaly Detection: The Bottom Line*

- ❑ *Anomaly-based IDS is active research topic*
- ❑ *Many security experts have high hopes for its ultimate success*
- ❑ *Often cited as key future security technology*
- ❑ *Hackers are not convinced!*
  - *Title of a talk at Defcon: “Why Anomaly-based IDS is an Attacker’s Best Friend”*
- ❑ *Anomaly detection is difficult and tricky*
- ❑ *As hard as AI?*
